A Data Flow Diagram (DFD) is a graphical representation used in systems analysis and design to visualize how data moves through an information system.

The Four Key Elements of a DFD:

External Entities (Rectangles): These are the people or departments outside the system that provide data (Sources) or receive it (Sinks). Examples: Employee, Finance, HR Staff.

Processes (Rounded Rectangles/Circles): These represent the "work" or activities that transform input data into output. Examples: 1.0 Manage Employee Information, 2.0 Payroll Management.

Data Stores (Open-ended Rectangles): These represent data at rest, such as databases or files where information is kept for later use. Examples: D1 Employee Master File, D3 Payroll Records.

Data Flows (Arrows): These illustrate the specific information being moved between the other components. Examples: Payslip, Recruitment Data, Strategic HR Reports.

The following documentation breaks down the four core functional areas of the system.

1.0 Core Human Capital (Manage Employee Information)

This process serves as the foundation data entry point for the 201 files or official personal records. This module handles Employee profile, Job and Role Management and Recruitment Onboarding. It converts raw recruitment data and employee information into standardized records stored in the Employee Master File (D1). and also it ensures that the attendance and leave records are updated to provide accurate data for payroll processing

2.0 Payroll Management

This process lets the system manage and execute payments automatically, from approval up to releasing funds, with minimal human intervention. It is responsible for Employee Salary calculations and Payslip Generation. It cross-check attendance data with employee master data to compute correct employee payments. It generate payroll report and audits to ensure financial transparency and accuracy

3.0 Compensation Planning (Compensation & Benefits) This process manages the strategic, financial, and regulatory components of employee compensation. It oversees salary structure management, bonus and incentive allocation, and benefits administration in compliance with organizational policies and statutory requirements.

The module applies Compensation and Benefits Rules (D4) to validate compensation budgeting while ensuring adherence to compliance and reporting standards. It also incorporates performance evaluation data from the Core Human Capital module to support merit-based salary and incentive adjustments.

4.0 HR Analytics & Reporting

This module serves as the business intelligence layer of the Human Resources System. It consolidates and analyzes data related to attendance and time, employee performance, and recruitment activities.

By aggregating information from all primary HR data stores (D1–D4), the module transforms raw operational data into strategic HR reports. These reports enable management to monitor workforce trends, evaluate organizational performance, and support data-driven decision-making for the microfinance institution.

DATA FLOW DIAGRAM

A Workflow Diagram is a visual representation of a business process, showing the sequential steps, decision points, and actions required to complete a specific task.

The Five Key Component of Workflow Diagram:

Terminator (Oval)

Indicates where the HR process officially begins and ends. The *Start* marks the initiation of an HR operation (such as data entry or payroll execution), while the *End* confirms that all required actions have been completed and outputs (e.g., payroll release or reports) have been finalized.

Process / Action (Rectangle)

Represents an actual operation performed by the system or HR personnel. These steps transform data, such as validating employee records, computing salaries, or updating payroll information.

Decision (Diamond)

Represents a control checkpoint where the system evaluates conditions (e.g., data completeness or rule compliance). Based on the result (Yes or No), the workflow either proceeds to the next stage or loops back for correction.

Data Input / Output (Parallelogram)

Represents information entering or leaving the system, such as employee details, attendance records, or generated payroll summaries used by other modules or stakeholders.

Data Storage (Cylinder)

Represents persistent data repositories where information is stored and retrieved throughout the workflow. Examples include the Employee Master File (D1) for employee records and Payroll Records (D3) for salary and payment history.

This workflow represents the end-to-end operational cycle of the Human Resources System. It illustrates how employee data flows from initial data entry and validation through compensation planning and concludes with payroll processing and final salary disbursement.

The process begins with the ingestion of human capital data sourced from HR1 (Recruitment and Employee Profile) and HR3 (Attendance and Performance). All incoming data is validated against Core Human Capital business rules to ensure accuracy, consistency, and compliance. If validation errors are identified, the system initiates a request for data correction, preventing invalid records from propagating to downstream processes. Upon successful validation, the system updates the Employee Master File (D1) to maintain a centralized and current repository of employee information.

Following the successful validation and storage of employee master data, the system transitions to financial processing. Compensation planning is conducted using insights derived from the Employee Master File and HR Analytics to establish appropriate salary structures, benefits, and incentive allocations. Subsequently, payroll execution is initiated, generating compensation calculations that are subject to formal Finance approval. A critical quality control checkpoint evaluates whether payroll and compensation outputs are approved. If approval is not granted, the system enters a payroll revision loop to correct discrepancies and ensure accuracy before proceeding.

The final phase of the workflow ensures the secure delivery of employee compensation and the preservation of payroll records. The system determines the appropriate payslip distribution method, either generating and emailing a password-protected PDF payslip or producing a printed physical copy. All payroll transactions are subjected to a final audit to verify compliance with organizational policies and regulatory standards. Upon successful verification, finalized payroll data is archived in the Payroll Records repository (D3). This repository also serves as a data source for generating strategic HR reports for executive review and decision-making.
